Maintenance Windows

- **2019-07-09 till 2019-07-12**
  1. MTU issue: The default Networks MWN and internet public to all user have been configured incorrectly. At the moment the MTU size of a network interface attached to a VM is set to 1450. Docker and Windows "do not like this". we will migrate all current network interfaces to a copy of the internet and MWN networks which will finally run a MTU size of 1500.
  2. Impact to the users of the VM all MAC addresses inside the VM will change, but all IP addresses (internal/ floating) will stay the same and work. This is considered to be be OK.
  3. All VMs will be rebooted due to a necessary firmware upgrade of the hardware and the need to partially recable the hardware.
