

Table of Contents for the slides

Introductory remarks

- History and Usage of Fortran – Conventions used – References: 2-7

Basic Fortran Syntax

- A first program – declarations and executable statements – compiling and running: 9-12
- Rules for simple I/O, source layout and names: 13-17
- Type system – intrinsic types (numeric and non-numeric) – simple arrays: 18-26
- Conditional execution – overview of block constructs – looping constructs – fine-grained execution control – termination of execution: 27-38

Expressions and Assignment

- Data representations and associated intrinsics: 40-44
- Assignment and conversions: 45-49
- Expressions – operators – evaluation order – precedence – mixed mode: 50-61

Subprogram units

- concept of (module) procedure – invocation of procedure – separate compilation – explicit interface – procedure execution: 63-71
- declaring INTENT for dummy arguments: 72-73
- functions – OPTIONAL arguments – recursive procedures – internal procedures: 74-79
- simple array and character string dummy arguments: 80-82
- side effects in procedure calls – aliasing rules – PURE procedures – VALUE attribute: 84-94
- manual interface specifications – basic interoperation with C interfaces – procedures as arguments – abstract interface: 96-102

Derived Types and more on Modules

- declaration of derived types and structures – structure constructor – accessing type components – storage layout: 104-108
- concept of module – module variables – information hiding (PRIVATE and PUBLIC attribute) – PROTECTED attribute: 109-116
- how USE association works – managing the name space – ONLY option and renaming – handling libraries: 117-127

Array Processing (1)

- array rank, bounds and shape – array sections – array constructor and assignment – vector subscripts – array expressions: 129-137
- array intrinsics (reductions, location, transformational): 138-144
- performance considerations – basic processor architecture – memory hierarchy and cache – temporal and spatial locality – synthetic kernels – Fortran features for performance: 146-159

Fortran environment and various properties of objects

- intrinsic module ISO_FORTRAN_ENV – intrinsics for environment handling: 161-164
- nested scoping examples – IMPORT statement – lifetime of an object – SAVE attribute: 166-170

- constant expressions – initialization of objects – implied DO – default initialization – specification expressions – automatic variables: 172-183

Array processing (2)

- assumed shape dummy argument – memory layout – CONTIGUOUS attribute – assumed size dummy argument – explicit shape argument: 185-194
- array-valued functions – elemental procedures – masked array operations with WHERE – FORALL and DO CONCURRENT constructs: 195-204

Dynamic entities and memory management

- memory organization – ALLOCATABLE entities – auto-allocation and MOVE_ALLOC: 206-214
- POINTER attribute and semantics – aliasing of objects and subobjects: 215-221
- Container types (POINTER and ALLOCATABLE type components): 222-225
- POINTER and ALLOCATABLE dummy arguments and function results, suggested practices for use of dynamic objects: 226-233
- further performance considerations for arrays and dynamic objects – parameterized derived types – comparing performance (array of derived type vs. object of parameterized derived type): 235-246

Generic interfaces and overloading

- named interface – distinguishability (type, kind, rank) – working across modules: 248-251
- handling array ranks – assumed-rank array and the SELECT RANK block construct: 252-255
- overloading of constructors and intrinsic operators – user-defined operators: 256-262
- renaming of operators – further generic resolution rules – overloading of assignment: 263-265

Input and Output to external storage

- concept of record and file – I/O units – opening and closing files – identifying a usable unit: 267-271
- I/O transfer via READ/WRITE – I/O lists – list-directed formatting – edit descriptors and their classification – format definition – details on some edit descriptors: 272-282
- format exhaustion and reversion – unformatted I/O: 283-286
- details on OPEN and CLOSE – changeable connection modes – INQUIRE on files and units: 287-295
- direct access files – file positioning – error handling for I/O: 296-303
- namelist processing – internal I/O: 304-307
