

# PRACE Workshop: Deep Learning and GPU programming workshop

7 – 10 September 2020

IT4INNOVATIONS NATIONAL SUPERCOMPUTING CENTER

# MODULE FOUR: GPU PROGRAMMING

Dr. Volker Weinberg | LRZ | 08.09.2020

## MODULE OVERVIEW

**OpenACC Directives** 

- Multicore CPU vs GPU
- Introduction to GPU Data Management
- CUDA Managed Memory
- GPU Profiling with PGProf

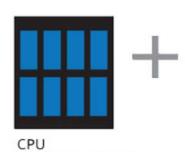

### CPU VS GPU

### CPU VS GPU Number of cores and parallelism

- Both are extremely popular parallel processors, but with different degrees of parallelism
- CPUs generally have a small number of very fast physical cores
- GPUs have thousands of simple cores able to achieve high performance in aggregate
- Both require parallelism to be fully utilized, but GPUs require much more

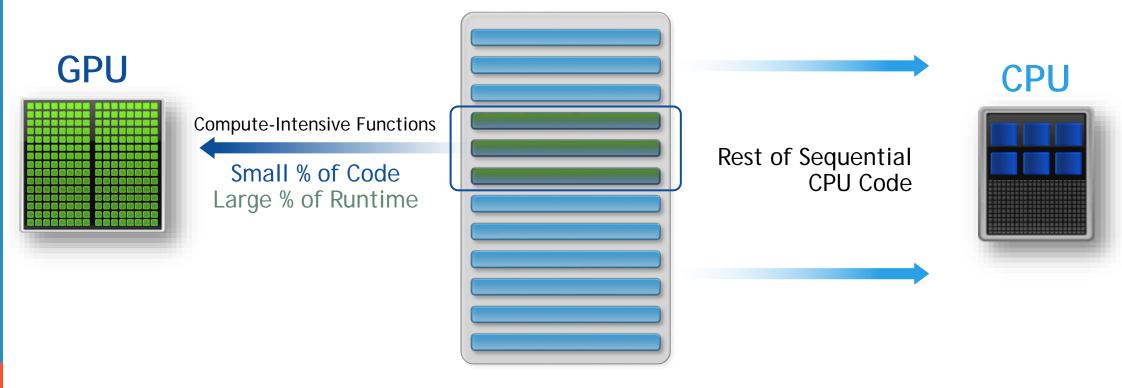

MULTIPLE CORES

GPU THOUSANDS OF CORES

### CPU + GPU WORKFLOW

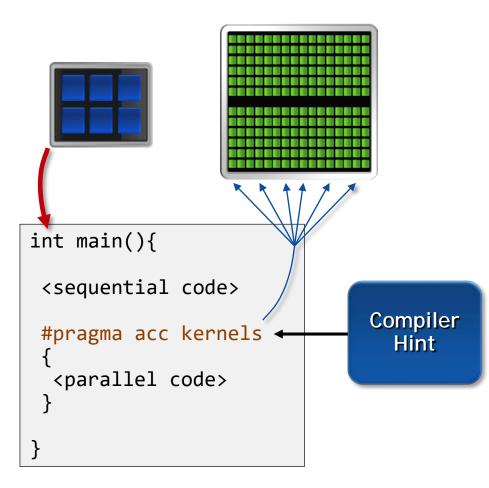

#### **Application Code**

### GPU PROGRAMMING IN OPENACC

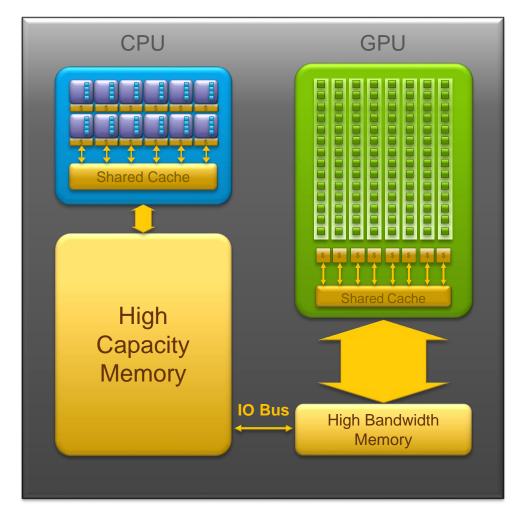

- Execution always begins and ends on the host CPU
- Compute-intensive loops are offloaded to the GPU using directives
- Offloading may or may not require data movement between the *host* and *device*.

- CPU memory is larger, GPU memory has more bandwidth
- CPU and GPU memory are usually separate, connected by an I/O bus (traditionally PCI-e)
- Any data transferred between the CPU and GPU will be handled by the I/O Bus
- The I/O Bus is relatively slow compared to memory bandwidth
- The GPU cannot perform computation until the data is within its memory

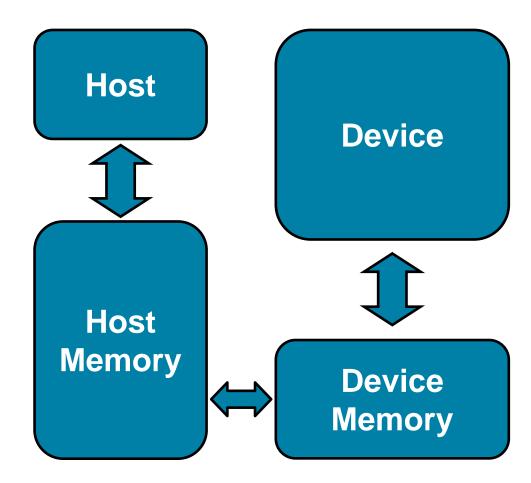

### Between the host and device

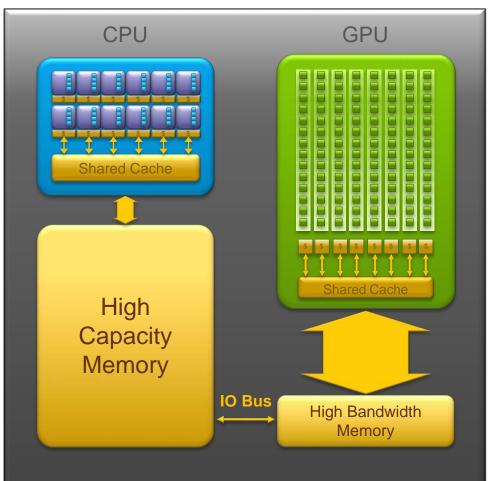

- The host is traditionally a CPU
- The device is some parallel accelerator
- When our target hardware is multicore, the host and device are the same, meaning that their memory is also the same
- There is no need to explicitly manage data when using a shared memory accelerator, such as the multicore target

### Between the host and device

- When the target hardware is a GPU data will usually need to migrate between CPU and GPU memory
- The next lecture will discuss OpenACC data management, for now we'll assume a unified Host/Accelerator memory

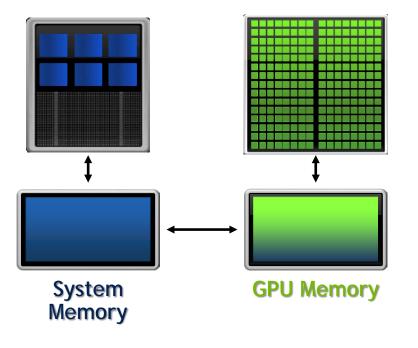

### CUDA MANAGED MEMORY

## CUDA MANAGED MEMORY

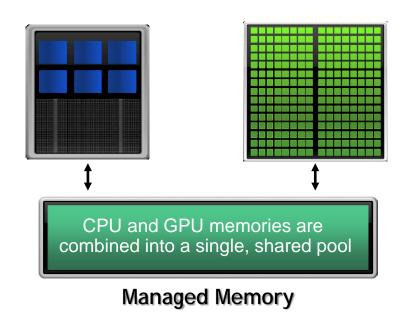

### Simplified Developer Effort

Without Managed Memory

## Commonly referred to as "unified memory."

#### With Managed Memory

### CUDA MANAGED MEMORY Usefulness

- Handling explicit data transfers between the host and device (CPU and GPU) can be difficult
- The PGI compiler can utilize CUDA Managed Memory to defer data management
- This allows the developer to concentrate on parallelism and think about data movement as an optimization

\$ pgcc -fast -acc -ta=tesla:managed -Minfo=accel main.c

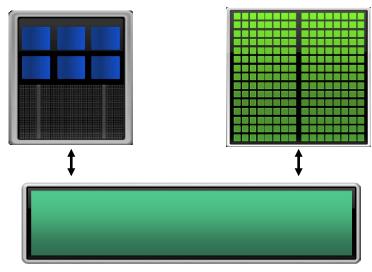

\$ pgfortran -fast -acc -ta=tesla:managed -Minfo=accel main.f90

### MANAGED MEMORY Limitations

- The programmer will almost always be able to get better performance by manually handling data transfers
- Memory allocation/deallocation takes longer with managed memory
- Cannot transfer data asynchronously
- Currently only available from PGI on NVIDIA GPUs.

#### With Managed Memory

Managed Memory

### OPENACC WITH MANAGED MEMORY

### An Example from the Lab Code

```
while ( error > tol && iter < iter max )
  error = 0.0;
#pragma acc kernels
    for( int j = 1; j < n-1; j++)</pre>
      for( int i = 1; i < m-1; i++ )</pre>
        Anew[j][i] = 0.25 * (A[j][i+1] + A[j][i-1])
                              + A[j-1][i] + A[j+1][i]);
        error = fmax( error, fabs(Anew[j][i] - A[j][i]));
    for( int j = 1; j < n-1; j++)</pre>
      for( int i = 1; i < m-1; i++ )</pre>
        A[j][i] = Anew[j][i];
OpenACC
```

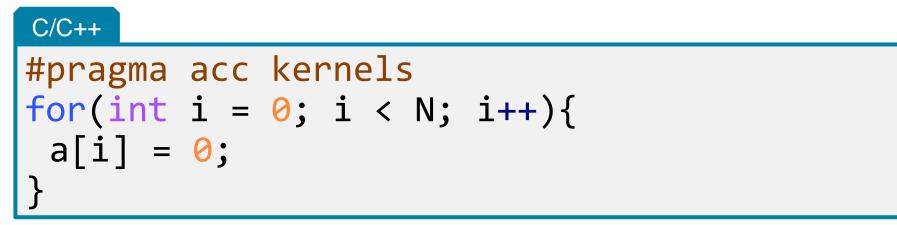

Without Managed Memory the compiler must determine the size of A and Anew and copy their data to and from the GPU each iteration to ensure correctness

With Managed Memory the underlying runtime will move the data only when needed

### **INTRODUCTION TO DATA CLAUSES**

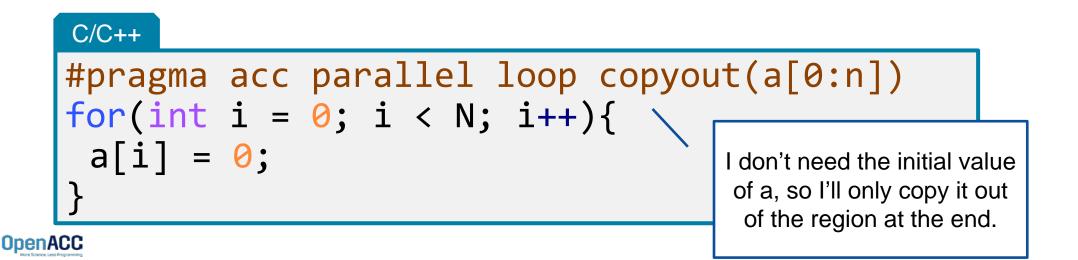

- Data clauses allow the programmer to tell the compiler which data to move and when
- Data clauses may be added to kernels or parallel regions, but also data, enter data, and exit data, which will discussed shortly

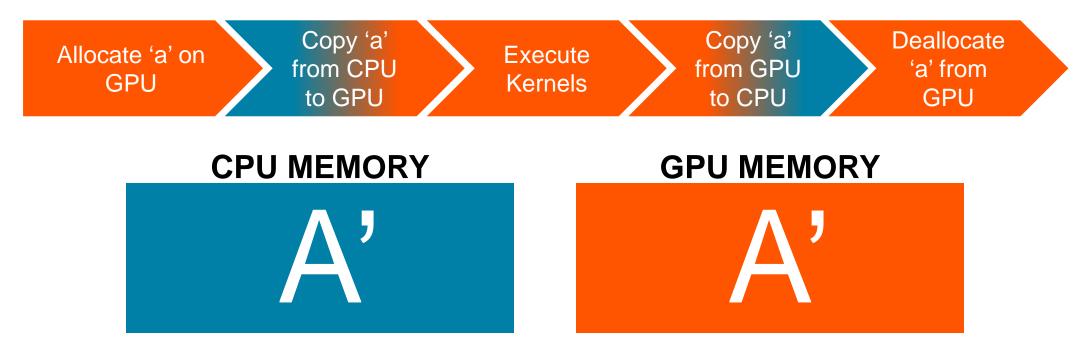

- Data clauses allow the programmer to tell the compiler which data to move and when
- Data clauses may be added to kernels or parallel regions, but also data, enter data, and exit data, which will discussed shortly

```
#pragma acc parallel loop copy(a[0:N])
for(int i = 0; i < N; i++){
    a[i] = 2 * a[i];
}</pre>
```

### DATA CLAUSES

**COPY**(*list*) Allocates memory on GPU and copies data from host to GPU when entering region and copies data to the host when exiting region.

**Principal use:** For many important data structures in your code, this is a logical default to input, modify and return the data.

**copyin(** *list* ) Allocates memory on GPU and copies data from host to GPU when entering region.

**Principal use:** Think of this like an array that you would use as just an input to a subroutine.

**copyout(** *list* ) Allocates memory on GPU and copies data to the host when exiting region.

**Principal use:** A result that isn't overwriting the input data structure.

**create(** *list* **)** Allocates memory on GPU but does not copy.

OpenACC

Principal use: Temporary arrays.

### ARRAY SHAPING

- Sometimes the compiler needs help understanding the shape of an array
- The first number is the start index of the array
- In C/C++, the second number is how much data is to be transferred
- In Fortran, the second number is the ending index

copy(array[starting\_index:length]) C/C++
copy(array(starting\_index:ending\_index)) Fortran

Multi-dimensional Array shaping

copy(array[0:N][0:M])

C/C++

Obtaining information about your GPU

 Using the pgaccelinfo command will display information about available accelerators

#### Terminal Window

```
$ pgaccelinfo
Device Number: 0
Device Name: Tesla P100-PCIE-16GB
...
Managed Memory: Yes
PGI Compiler Option: -ta=tesla:cc60
```

Obtaining information about your GPU

- Using the pgaccelinfo command will display information about available accelerators
- Each device is numbered starting with
   0

#### Terminal Window

#### \$ pgaccelinfo Device Number: 0 Device Name: Tesla P100-PCIE-16GB ... Managed Memory: Yes PGI Compiler Option: -ta=tesla:cc60

### Obtaining information about your GPU

- Using the pgaccelinfo command will display information about available accelerators
- Each device is numbered starting with
   0
- The Device Name identifies the type of accelerator

#### Terminal Window

\$ pgaccelinfo
Device Number: 0
Device Name: Tesla P100-PCIE-16GB
• • •
Managed Memory: Yes
PGI Compiler Option: -ta=tesla:cc60

### Obtaining information about your GPU

- Using the pgaccelinfo command will display information about available accelerators
- Each device is numbered starting with
   0
- The Device Name identifies the type of accelerator
- Can Managed Memory be used?

#### Terminal Window

<pre>\$ pgaccelinfo</pre>	
Device Number: 0	
Device Name: Tesla P	100-PCIE-16GB
Managed Memory: Yes	
PGI Compiler Option:	-ta=tesla:cc60

### Obtaining information about your GPU

- Using the pgaccelinfo command will display information about available accelerators
- Each device is numbered starting with
   0
- The Device Name identifies the type of accelerator
- Can Managed Memory be used?
- What compiler options should be used to target this device?

#### Terminal Window

<pre>\$ pgaccelinfo Device Number: 0 Device Name: Tesla P100-PCIE-16GB</pre>
 Managed Memory: Yes
PGI Compiler Option: -ta=tesla:cc60

Without Manage Memory

\$ pgcc -ta=tesla:cc60 main.c

With Manage Memory

\$ pgcc -ta=tesla:cc60,managed main.c

### COMPILING GPU CODE

#### Terminal Window

OpenACC

```
$ pgcc -fast -ta=tesla:cc60 -Minfo=accel jacobi.c laplace2d.c
  calcNext:
        37, Generating copy(Anew[:m*n],A[:m*n])
            Accelerator kernel generated
            Generating Tesla code
            37, Generating reduction(max:error)
            38, #pragma acc loop gang /* blockIdx.x */
            41, #pragma acc loop vector(128) /* threadIdx.x */
        41, Loop is parallelizable
  swap:
        56, Generating copy(Anew[:m*n],A[:m*n])
            Accelerator kernel generated
            Generating Tesla code
            57, #pragma acc loop gang /* blockIdx.x */
            60, #pragma acc loop vector(128) /* threadIdx.x */
        60, Loop is parallelizable
```

We can see that our data copies are being applied by the compiler

## COMPILING GPU CODE

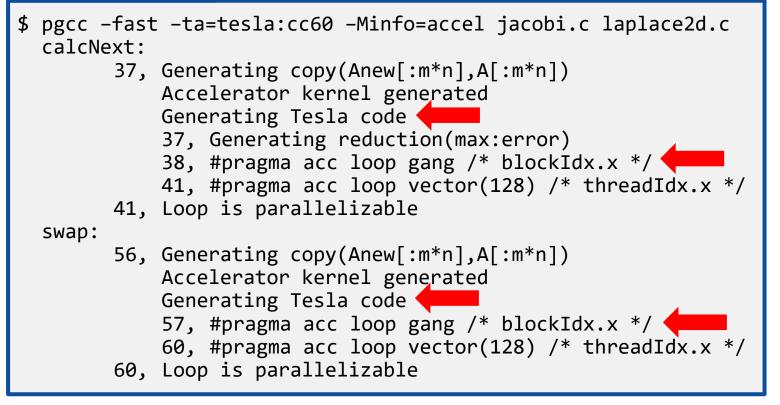

#### Terminal Window

```
$ pgcc -fast -ta=tesla:cc60 -Minfo=accel jacobi.c laplace2d.c
  calcNext:
        37, Generating copy(Anew[:m*n],A[:m*n])
            Accelerator kernel generated
            Generating Tesla code
            37, Generating reduction(max:error)
            38, #pragma acc loop gang /* blockIdx.x */
            41, #pragma acc loop vector(128) /* threadIdx.x */
        41, Loop is parallelizable
  swap:
        56, Generating copy(Anew[:m*n],A[:m*n])
            Accelerator kernel generated
            Generating Tesla code
            57, #pragma acc loop gang /* blockIdx.x */
            60, #pragma acc loop vector(128) /* threadIdx.x */
        60, Loop is parallelizable
```

We also see that the compiler is generating code for our GPU

### COMPILING GPU CODE

#### Terminal Window

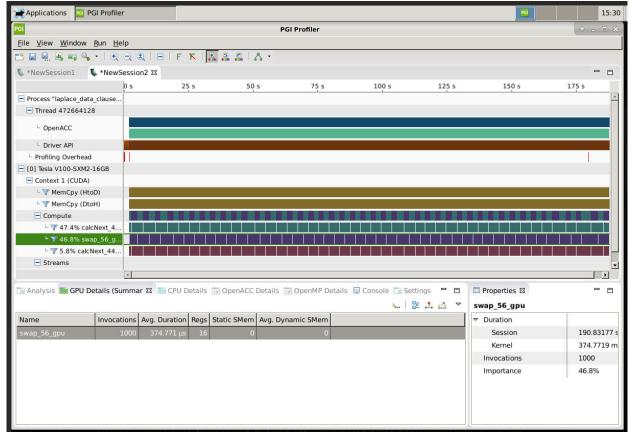

This is the parallelization of the **buter loop** 

Using PGPROF to profile GPU code

- PGPROF presents far more information when running on a GPU
- We can view CPU Details, GPU Details, a Timeline, and even do Analysis of the performance

Using PGPROF to profile GPU code

- MemCpy(HtoD): This includes data transfers from the Host to the Device ' (CPU to GPU)
- MemCpy(DtoH): These are data transfers from the Device to the Host (GPU to CPU)
- Compute: These are our computational functions. We can see our calcNext and swap function

Receiving unexpected code results

- Here we can see the runtime of our application: 151 seconds
- The program is now performing over 3 times worse than the sequential version
- A profiler can help us understand why this performance is worse

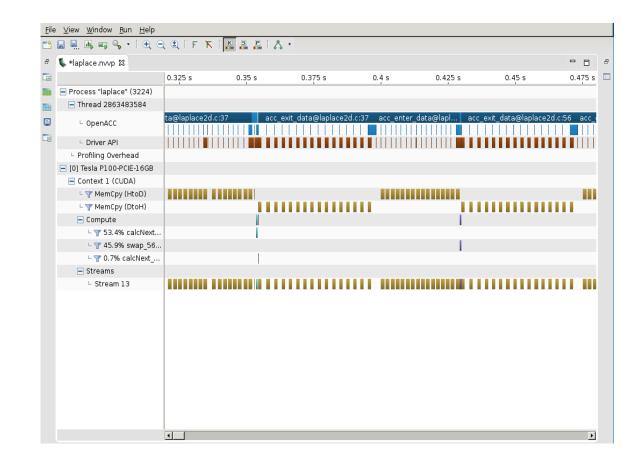

#### Terminal Window

\$ pgcc	<pre>-ta=tesla:cc60</pre>	jacobi.c	laplace2d.c
\$ ./a.d	out		
0,	0.250000		
100,	0.002397		
200,	0.001204		
300,	0.000804		
400,	0.000603		
500,	0.000483		
600,	0.000403		
700,	0.000345		
800,	0.000302		
900,	0.000269		
total	l: 151.772627 s		

### Inspecting the PGPROF timeline

- Zooming in gives us a better view of the timeline
- At a first glance, it looks like our program is spending a significant amount of time transferring data between the host and device
- We also see that the compute regions are very small and spread out
- What if we try Managed Memory?

Using managed memory

- Using managed memory drastically improves performance
- This managed memory version is performing over 20x better than the sequential code
- What does the profiler tell us about this?

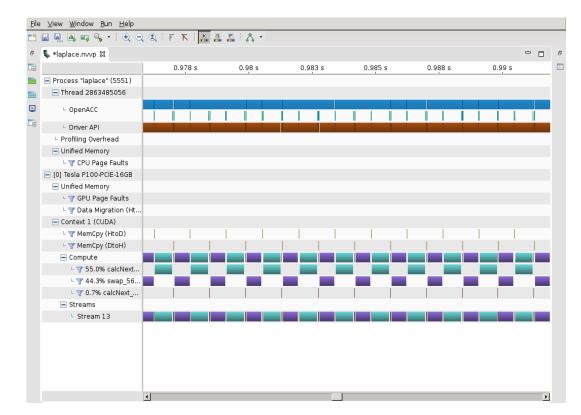

#### Terminal Window

```
$ pgcc -ta=tesla:cc60,managed jacobi.c
 laplace2d.c
$ ./a.out
   0, 0.250000
  100, 0.002397
  200, 0.001204
  300, 0.000804
 400, 0.000603
  500, 0.000483
 600, 0.000403
  700, 0.000345
 800, 0.000302
 900, 0.000269
  total: 1.474951 s
```

### Using managed memory

- The data no longer needs to transfer between each kernel
- The data is only moved when it's first accessed on the GPU or CPU
- During the timestepping data remains on the device
- Now a higher percentage of time is spent computing

### ERRATA

- In the section Including Data Clauses in our Laplace Code
- Use !pgcc -fast -ta=tesla,managed -Minfo=accel -o laplace\_data\_clauses jacobi.c laplace2d.c && ./laplace\_data\_clauses 1024 1024

-ta=tesla instead of -ta=tesla, managed

## **KEY CONCEPTS**

In this module we discussed...

- The fundamental differences between CPUs and GPUs
- Assisting the compiler by providing information about array sizes for data management
- Managed memory

# THANK YOU
