

# MODULE FIVE: DATA MANAGEMENT

Dr. Volker Weinberg | LRZ

# MODULE OVERVIEW

## OpenACC Data Management

- Explicit Data Management
- OpenACC Data Regions and Clauses
- Unstructured Data Lifetimes
- Data Synchronization

# EXPLICIT MEMORY MANAGEMENT

# EXPLICIT MEMORY MANAGEMENT

## Requirements

- Data must be visible on the **device** when we run our **parallel** code
- Data must be visible on the **host** when we run our **sequential** code
- When the host and device don't share memory, data movement must occur
- To maximize performance, the programmer should avoid all unnecessary data transfers

# EXPLICIT MEMORY MANAGEMENT

## Key problems

- Many parallel accelerators (such as devices) have a separate memory space from the host
- These separate memories can become out-of-sync and contain completely different data
- Transferring between these two memories can be a very time consuming process

# OPENACC DATA DIRECTIVE

# OPENACC DATA DIRECTIVE

## Definition

- The data directive defines a lifetime for data on the device
- During the region data should be thought of as residing on the accelerator
- Data clauses allow the programmer to control the allocation and movement of data

```
#pragma acc data clauses  
{  
    < Sequential and/or Parallel code >  
}
```

```
!$acc data clauses  
    < Sequential and/or Parallel code >  
!$acc end data
```

# DATA CLAUSES

`copy( list )`

**Allocates memory on device and copies data from host to device when entering region and copies data to the host when exiting region.**

**Principal use:** For many important data structures in your code, this is a logical default to input, modify and return the data.

`copyin( list )`

**Allocates memory on device and copies data from host to device when entering region.**

**Principal use:** Think of this like an array that you would use as just an input to a subroutine.

`copyout( list )`

**Allocates memory on device and copies data to the host when exiting region.**

**Principal use:** A result that isn't overwriting the input data structure.

`create( list )`

**Allocates memory on device but does not copy.**

**Principal use:** Temporary arrays.

# IMPLIED DATA REGIONS

# IMPLIED DATA REGIONS

## Definition

- Every **kernels** and **parallel** region has an implicit data region surrounding it
- This allows data to exist solely for the duration of the region
- All data clauses usable on a **data** directive can be used on a **parallel** and **kernels** as well

```
#pragma acc kernels copyin(a[0:100])
{
    for( int i = 0; i < 100; i++ )
    {
        a[i] = 0;
    }
}
```

# IMPLIED DATA REGIONS

## Explicit vs Implicit Data Regions

### Explicit

```
#pragma acc data copyin(a[0:100])
{
  #pragma acc kernels
  {
    for( int i = 0; i < 100; i++ )
    {
      a[i] = 0;
    }
  }
}
```

### Implicit

```
#pragma acc kernels copyin(a[0:100])
{
  for( int i = 0; i < 100; i++ )
  {
    a[i] = 0;
  }
}
```

These two codes are functionally the same.

# EXPLICIT VS. IMPLICIT DATA REGIONS

## Limitation

### Explicit

1 Data Copy

```
#pragma acc data copyout(a[0:100])  
{  
  
    #pragma acc kernels  
    {  
        a[i] = i;  
    }  
  
    #pragma acc kernels  
    {  
        a[i] = 2 * a[i];  
    }  
  
}
```

### Implicit

2 Data Copies

```
#pragma acc kernels copyout(a[0:100])  
{  
    a[i] = i;  
}  
  
#pragma acc kernels copy(a[0:100])  
{  
    a[i] = 2 * a[i];  
}
```

The code on the left will perform better than the code on the right.

# UNSTRUCTURED DATA DIRECTIVES

# UNSTRUCTURED DATA DIRECTIVES

## Enter Data Directive

- Data lifetimes aren't always neatly structured.
- The **enter data** directive handles device memory **allocation**
- You may use either the **create** or the **copyin** clause for memory allocation
- The enter data directive is **not** the start of a data region, because you may have multiple enter data directives

```
#pragma acc enter data clauses
```

```
< Sequential and/or Parallel code >
```

```
#pragma acc exit data clauses
```

```
!$acc enter data clauses
```

```
< Sequential and/or Parallel code >
```

```
!$acc exit data clauses
```

# UNSTRUCTURED DATA DIRECTIVES

## Exit Data Directive

- The **exit data** directive handles device memory **deallocation**
- You may use either the **delete** or the **copyout** clause for memory deallocation
- You should have as many **exit data** for a given array as **enter data**
- These can exist in different functions

```
#pragma acc enter data clauses
```

```
< Sequential and/or Parallel code >
```

```
#pragma acc exit data clauses
```

```
!$acc enter data clauses
```

```
< Sequential and/or Parallel code >
```

```
!$acc exit data clauses
```

# UNSTRUCTURED DATA CLAUSES

- `copyin ( list )` Allocates memory on device and copies data from host to device on enter data.
- `copyout ( list )` Allocates memory on device and copies data back to the host on exit data.
- `create ( list )` Allocates memory on device without data transfer on enter data.
- `delete ( list )` Deallocates memory on device without data transfer on exit data

# UNSTRUCTURED DATA DIRECTIVES

## Basic Example

```
#pragma acc parallel loop
for(int i = 0; i < N; i++){
    c[i] = a[i] + b[i];
}
```

# UNSTRUCTURED DATA DIRECTIVES

## Basic Example

```
#pragma acc enter data copyin(a[0:N],b[0:N]) create(c[0:N])

#pragma acc parallel loop
for(int i = 0; i < N; i++){
    c[i] = a[i] + b[i];
}

#pragma acc exit data copyout(c[0:N])
```

# UNSTRUCTURED DATA DIRECTIVES

## Basic Example

```
#pragma acc enter data copyin(a[0:N], b[0:N]) create(c[0:N])  
  
#pragma acc parallel loop  
for(int i = 0; i < N; i++){  
    c[i] = a[i] + b[i];  
}  
  
#pragma acc exit data copyout(c[0:N])
```

Action

Copy B  
Data from  
device to  
device

CPU MEMORY

device MEMORY

# UNSTRUCTURED DATA DIRECTIVES

## Basic Example – proper memory deallocation

```
#pragma acc enter data copyin(a[0:N],b[0:N]) create(c[0:N])

#pragma acc parallel loop
for(int i = 0; i < N; i++){
    c[i] = a[i] + b[i];
}

#pragma acc exit data copyout(c[0:N]) delete(a,b)
```

Action

Deallocate ~~B~~  
from  
device

**CPU MEMORY**

**device MEMORY**

# UNSTRUCTURED VS STRUCTURED

With a simple code

## Unstructured

- Can have multiple starting/ending points
- Can branch across multiple functions
- Memory exists until explicitly deallocated

```
#pragma acc enter data copyin(a[0:N],b[0:N]) \  
create(c[0:N])
```

```
#pragma acc parallel loop  
for(int i = 0; i < N; i++){  
    c[i] = a[i] + b[i];  
}
```

```
#pragma acc exit data copyout(c[0:N]) \  
delete(a,b)
```

## Structured

- Must have explicit start/end points
- Must be within a single function
- Memory only exists within the data region

```
#pragma acc data copyin(a[0:N],b[0:N]) \  
copyout(c[0:N])
```

```
{  
    #pragma acc parallel loop  
    for(int i = 0; i < N; i++){  
        c[i] = a[i] + b[i];  
    }  
}
```

# UNSTRUCTURED DATA DIRECTIVES

## Branching across multiple functions

```
int* allocate_array(int N){
    int* ptr = (int *) malloc(N * sizeof(int));
    #pragma acc enter data create(ptr[0:N])
    return ptr;
}

void deallocate_array(int* ptr){
    #pragma acc exit data delete(ptr)
    free(ptr);
}

int main(){
    int* a = allocate_array(100);
    #pragma acc kernels
    {
        a[0] = 0;
    }
    deallocate_array(a);
}
```

- In this example enter data and exit data are in different functions
- This allows the programmer to put device allocation/deallocation with the matching host versions
- This pattern is particularly useful in C++, where structured scopes may not be possible.

# DATA SYNCHRONIZATION

# OPENACC UPDATE DIRECTIVE

**update:** Explicitly transfers data between the host and the device

Useful when you want to synchronize data in the middle of a data region

Clauses:

**self:** makes host data agree with device data

**device:** makes device data agree with host data

```
#pragma acc update self(x[0:count])  
#pragma acc update device(x[0:count])
```

C/C++

```
!$acc update self(x(1:end_index))  
!$acc update device(x(1:end_index))
```

Fortran

# OPENACC UPDATE DIRECTIVE

```
#pragma acc update device(A[0:N])
```

CPU Memory

device Memory

```
#pragma acc update self(A[0:N])
```

The data must exist on both the CPU and device for the update directive to work.

# SYNCHRONIZE DATA WITH UPDATE

```
int* allocate_array(int N){
    int* A=(int*) malloc(N*sizeof(int));
    #pragma acc enter data create(A[0:N])
    return A;
}

void deallocate_array(int* A){
    #pragma acc exit data delete(A)
    free(A);
}

void initialize_array(int* A, int N){
    for(int i = 0; i < N; i++){
        A[i] = i;
    }
    #pragma acc update device(A[0:N])
}
```

- Inside the **initialize** function we alter the host copy of 'A'
- This means that after calling **initialize** the host and device copy of 'A' are out-of-sync
- We use the **update** directive with the **device** clause to update the device copy of 'A'
- Without the **update** directive later compute regions will use incorrect data.

# MODULE REVIEW

# KEY CONCEPTS

In this module we discussed...

- Why explicit data management is necessary for best performance
- Structured and Unstructured Data Lifetimes
- Explicit and Implicit Data Regions
- The **data**, **enter data**, **exit data**, and **update** directives
- Data Clauses

# LAB ASSIGNMENT

In this module's lab you will...

- Update the code from the previous module to use explicit data directives
- Analyze the different between using CUDA Managed Memory and explicit data management in the lab code.
