

MULTI-GPU PROGRAMMING FOR CUDA C++

INTRODUCTION TO CUDA STREAMS

INTRODUCTION TO CUDA STREAMS

Stream Behavior

Default Stream Behavior

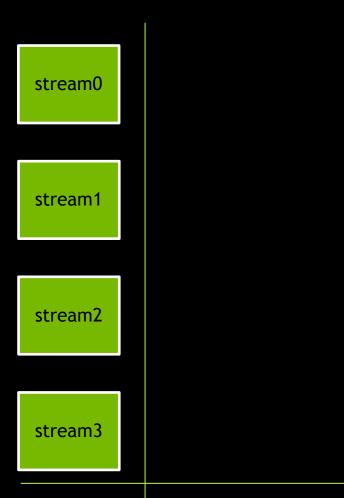

Streams in CUDA Programming

STREAM BEHAVIOR

A **stream** is a series of operations that occur in issue order on the GPU

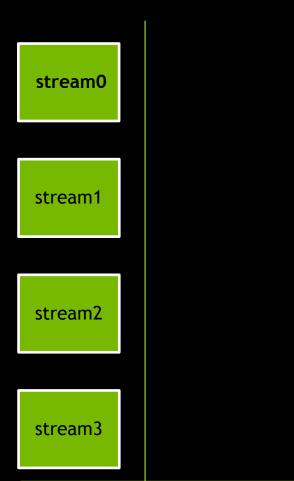

Multiple streams can be created and utilized by CUDA programmers

≻

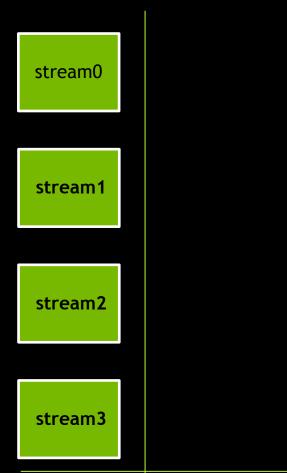

A special stream called the **default stream** (here labeled as stream0)

 \rightarrow

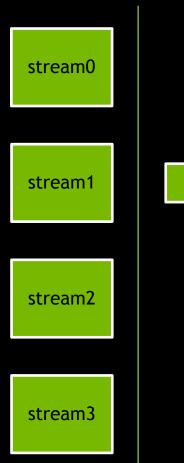

All other streams are referred to as **non-default streams** (here labelled streams 1-3)

Operations in the same stream will execute in issue order

opA(stream=stream1)

орА

Operations in the same stream will execute in issue order

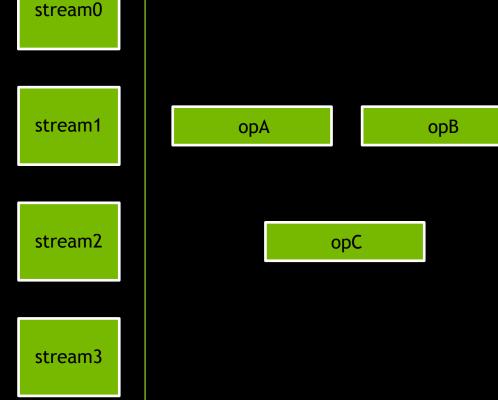

opA(stream=stream1)
opB(stream=stream1)

stream1 орА opB stream2 stream3

stream0

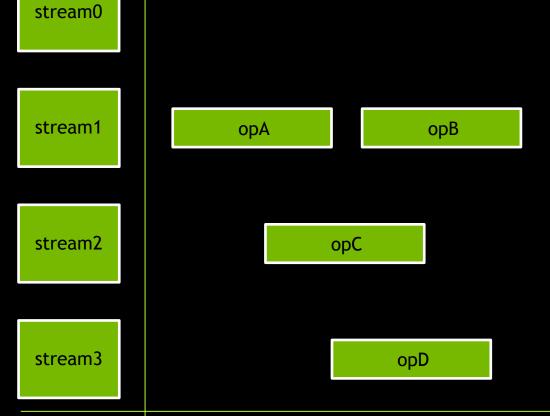

However, operations launched in different non-default streams have no fixed order of execution

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)

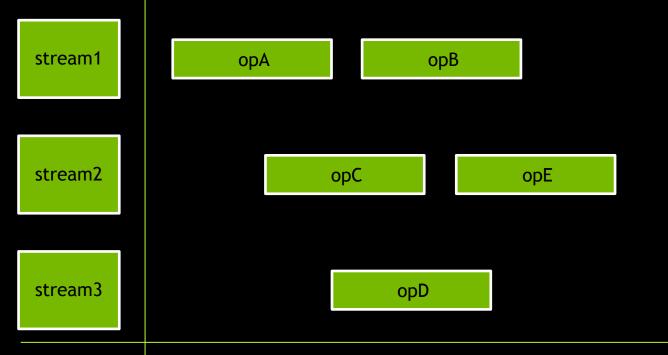

However, operations launched in different non-default streams have no fixed order of execution

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)
opD(stream=stream3)

However, operations launched in different non-default streams have no fixed order of execution

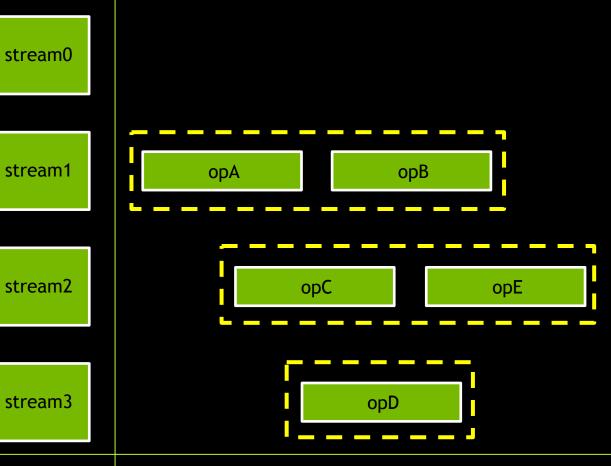

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)
opD(stream=stream3)
opE(stream=stream2)

stream0

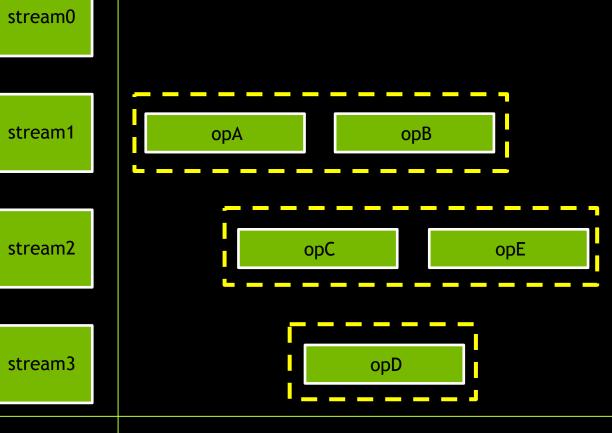

1. Operations issued into the same stream will execute in issue-order

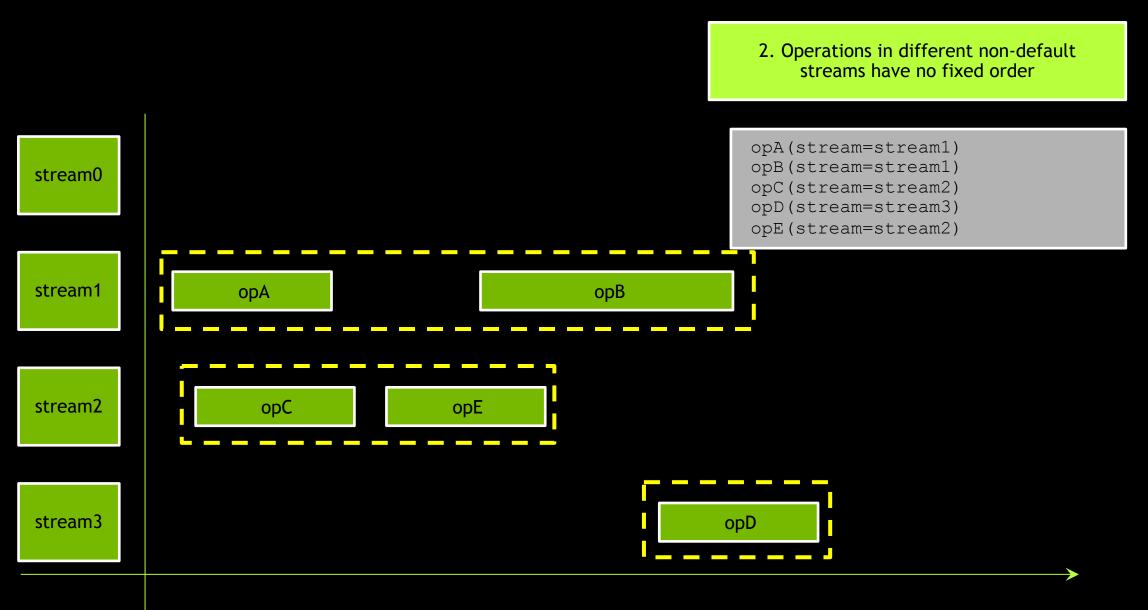

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)
opD(stream=stream3)
opE(stream=stream2)

2. Operations in different non-default streams have no fixed order

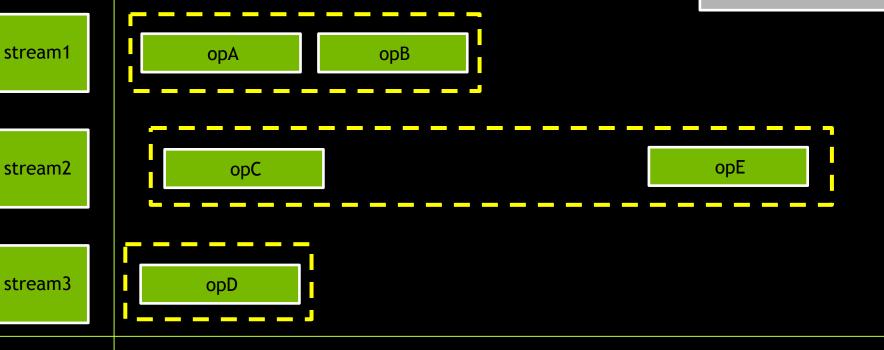

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)
opD(stream=stream3)
opE(stream=stream2)

2. Operations in different non-default streams have no fixed order

opA(stream=stream1)
opB(stream=stream1)
opC(stream=stream2)
opD(stream=stream3)
opE(stream=stream2)

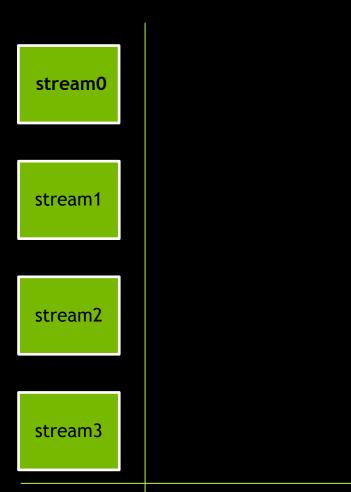

stream0

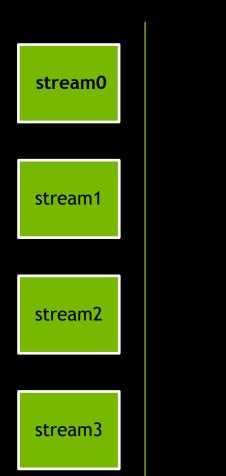

DEFAULT STREAM BEHAVIOR

The **default stream** is special

 \rightarrow

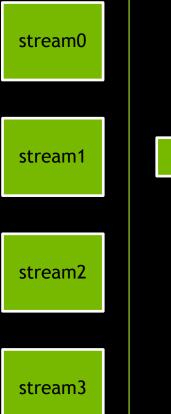

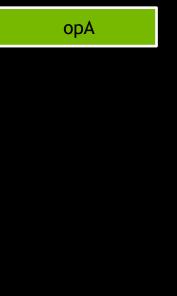

There can be no execution in any nondefault streams at the same time as any execution in the default stream

There can be no execution in any nondefault streams at the same time as any execution in the default stream

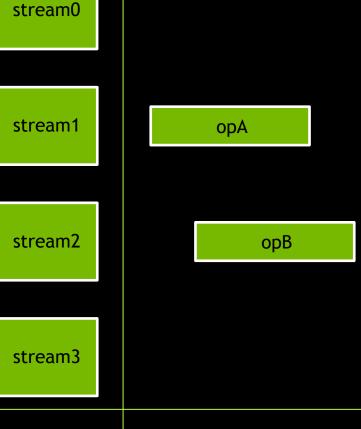

opA(stream=stream1)

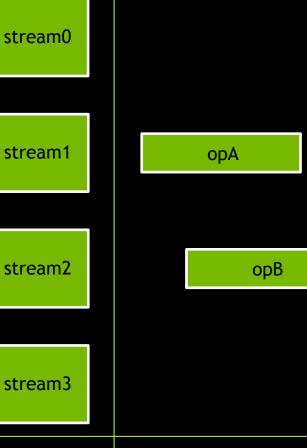

There can be no execution in any nondefault streams at the same time as any execution in the default stream

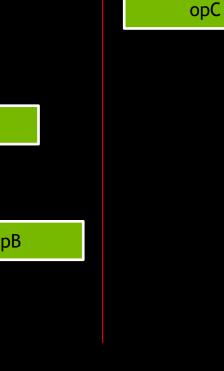

opA(stream=stream1)
opB(stream=stream2)

The default stream will both wait for all non-default stream execution to complete before beginning...

opA(stream=stream1)
opB(stream=stream2)
opC(stream=stream0)

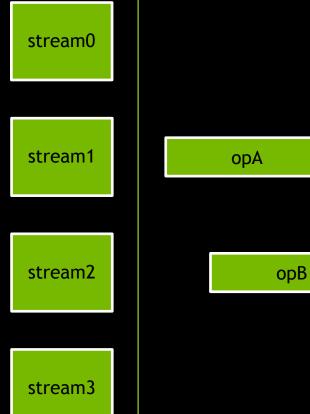

...and must complete before any other non-default stream work can begin

opA(stream=stream1)
opB(stream=stream2)
opC(stream=stream0)
opD(stream=stream1)

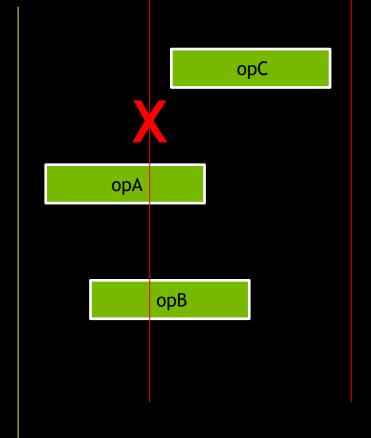

opD

opC

Default stream overlap with non-default streams cannot occur

opA(stream=stream1)
opB(stream=stream2)
opC(stream=stream0)
opD(stream=stream1)

opD

stream0

stream1

stream2

stream3

 \rightarrow

Х

Default stream overlap with non-default streams cannot occur

Х

opA(stream=stream1)
opB(stream=stream2)
opC(stream=stream0)
opD(stream=stream1)

Default stream overlap with non-default streams cannot occur

opA(stream=stream1)
opB(stream=stream2)
opC(stream=stream0)
opD(stream=stream1)

opD

орС

stream0 stream1 opA stream2 opB stream3

STREAMS IN CUDA PROGRAMMING

They all have a default value of 0, the default stream

They all have a default value of 0, the default stream

Look for cudaStream_t in the CUDA Runtime API docs

They all have a default value of 0, the default stream

Look for cudaStream_t in the CUDA Runtime API docs

We will be looking specifically at memory copies in non-default streams

When launched they have a default value of 0, the default stream

When launched they have a default value of 0, the default stream

They can be launched in a non-default stream using the 4th launch configuration argument

When launched they have a default value of 0, the default stream

They can be launched in a non-default stream using the 4th launch configuration argument

kernel<<<grid, block, shared_memory, stream>>>()
